

myCSG © 2026 | Area: ADaM | Concept: ADQS - Full ADQS - Questionnaire Analysis Dataset | Lesson: ADaM_ADQS_L1101 : ADQSEQ5D dataset for a parallel arm study - MYCSG-001 |

Lesson Description	Sproc	SAS Video	SAS Program	R Program
	• Creation of EQ5D-5L Analysis dataset: ◦ Includes paramcd, paramn, param, parcat1 and parcat1n derivation ◦ Includes creation of a derived parameter which is moderately complex (CHI - Composite Health Index) ◦ Includes baseline flagging and dependent variables creation - ABLFL, BASE, BASEC CHG ◦ Includes creation of an analysis flag- ANL01FL - to select one record per analysis visit/parameter/subject ◦ Includes creation of ANL02FL - to identify postbaseline records • What is EQ5D-5L ◦ It is a questionnaire that is used to evaluate the quality of life ◦ It is a descriptive system that comprises five dimensions: ▪ mobility ▪ self-care ▪ usual activities ▪ pain/discomfort ▪ anxiety/depression ◦ Each dimension has 5 levels: ▪ no problems ▪ slight problems ▪ moderate problems ▪ severe problems ▪ extreme problems ◦ The patient is asked to indicate his/her health state by ticking the box next to the most appropriate statement in each of the five dimensions. This decision results in a 1-digit number that expresses the level selected for that dimension. ◦ The digits for the five dimensions can be combined into a 5-digit number that describes the patient's health state.
