

Lesson Description	SAS SAS Program
	• Complete programming of an analysis dataset for intercurrent events • Analyses requires checking for the presence of an intercurrent event upto the start of a visit and upto the end of study • Lack of efficacy is considered as a specific intercurrent event • Any reason for discontinuation of study treatment other than 'Lack of efficacy' is considered as another intercurrent event • Also, summary is needed if at least one of the above two intercurrent events occurred. • Creating 3 parameters for each available visit in SV • Creating 1 additional derived visit 'Upto EOS' to check if intercurrent event occurred over any time on study
