

Concept Description	Lesson Description	Spec	SAS Video	SAS Program	R Video	R Program
	What is covered in this lesson? In this lesson we will see how to derive some of the key date variables in ADSL dataset. - Variables based on disposition data (SDTM.DS) - Date of informed consent (RFICDT) - Date of randomization (RANDDT) - Variables based on exposure data (SDTM.EX) - Date of first exposure to treatment (TRTSDT) - Date of last exposure to treatment (TRTEDT) - Variables based on subject visits data (SDTM.SV) - Date of first visit - Date of last visit SAS programming aspects covered in this lesson - Filtering required records using where statement or if statement - Selecting earliest or latest records using first. or last. approach - Extracting a substring from a string - Converting character date values to numeric date values - Usage of keep statement to select only required variables from an input dataset - Sorting observations in ascending or descending order based on required variables - Merging two or more datasets based on key variables - Usage of in= dataset option to identify whether a dataset contributed to an observation when merging
