ROWORDER	VARIABLE_NAME	VARIABLE_LABEL	DERIVATION
001	TRTSDT	Date of First Exposure to Treatment	Using EX dataset - get TRTSDT as the numeric(datepart(EXSTDTC)) of the earliest record of a subject where EXCAT="TREATMENT PERIOD" and EXDOSE >0 . Note that this date will be missing the subject has not been exposed to study treatment for any reason (or in case the team fails to capture the data in the EX dataset). Details: Subset the records from EX with the above given condition and sort by USUBJID and EXSTDTC and pick the earliest non-missing date.
002	TRTEDT	Date of Last Exposure to Treatment	Using EX dataset - get TRTEDT as the numeric(datepart(EXENDTC)) of the latest record of a subject where EXCAT="TREATMENT PERIOD" and EXDOSE >0. Note that this date will be missing the subject has not been exposed to study treatment for any reason (or in case the team fails to capture the data in the EX dataset). Details: Subset the records from EX with the above given condition and sort by USUBJID and EXENDTC and pick the latest non-missing date. Also note that this is the simplest case of derivation of TRTEDT - there can be multiple conditions to check for depending on how to handle ongoing subjects - which will be protocol specific.
003	TRT01P	Planned Treatment for Period 01	Using DM dataset - get TRT01P as the value present in DM.ARM variable. TRT01P will not be populated for the subjects who are screen failures (DM.ARM="Screen Failure") or who have not been assigned with any treatment yet (DM.ARM="Not Assigned").
004	TRT01A	Actual Treatment for Period 01	Using DM dataset - get TRT01A as the value present in DM.ACTARM variable. TRT01P will not be populated for the subjects who are screen failures (DM.ACTARM="Screen Failure") or who have not been assigned with any treatment yet (DM.ACTARM="Not Assigned").
