
- For analysis purposes, sometimes, we may want to group or categorize certain information
- ADaM specifies a standard convention for naming these grouping variables
- These variables have to end with a suffix of 'GRy', where y stands for the grouping algorithm scheme
- For example, there can be two different grouping alogorithms required for AGE - we name those groups as --GR1, GR2.
  - 1 indicates that the grouping algorithm 1 is applied
  - 2 indicates that the grouping algorithm 2 is applied
- As noted above, GRy is a suffix and the prefix can be the parent variable name where applicable
  - Grouping variables for AGE can be AGEGR1, AGEGR2 etc
  - Grouping variables for BMIBL can be BMIGR1, BMIGR2. Note that only a fragment of the parent variable name is used here as a prefix.
  - Grouping variables for SITEID can be SITEGR1, SITEGR2 etc. Note that only a fragment of the parent variable name is used here as a prefix.
- --GRy variables are used to represent the character categories and we can use --GRyN series to create numeric equivalents of each value in GRy.
  - For example, AGEGR1N can be used to store numeric variant of categories of AGEGR1

- In this lesson, we will see examples of creation of grouping variables for
  - Age
  - BMI
  - SITEID
