- This example is from a three period study in which each subject takes a different treatment in each period
- So, an adverse event could have been started in any period
- We want to create a separate treatment emergent flag for each period
- The start and end of each period is identified with APxxSDT and APxxEDT variables (xx=01, 02, 03)
- So, we compare adverse event start date with period start and end dates and create TRTEM1FL, TRTEM2FL and TRTEM3FL to check for treatment emergence in periods 1, 2 and 3 respectively.
