

	Text in statistical analysis plan - Systolic blood pressure (SYSBP), Diastolic blood pressure (DIABP) and Mean arterial pressure (MAP) will be summarized by visit. - Mean arterial pressure is the average arterial pressure throughout one cardiac cycle, systole, and diastole. - MAP is calculated as $MAP = (SYSBP + 2 (DIABP))/3$. - Note: Systolic and diastolic blood pressure are collected and mean arterial pressure is a new data point that needs to be derived in the analysis dataset.	
	Implementation in ADaM dataset - In ADaM implementation guide, there are certain rules that guide a user on when to add an analysis data point as a 'Row' and when to add it as a 'Column'. - Rule 5: A function of more than one parameter should be added as a new parameter In this scenario, our analysis datapoint MAP is a function of more than one parameter and hence we need to add it as a new parameter in the ADaM dataset.
