

Concept Description

Lesson Description

[Spec](#)[SAS Video](#)[SAS Program](#)[R Program](#)

- EQ5D is a questionnaire to assess the quality of life of subjects
- It collects responses for 5 dimesions (listed in table below)
- For each dimension, the response is a 5 level response - a number between 1 and 5.
- Each response for a test will have a score - for example, a response of 2 for mobility has a score of 0.051.
- A single number named composite health index (CHI) is generated for each assessment using the scores of all 5 dimensions
- So, this CHI is a function of more than one parameter.
- As per ADaM standard, an analysis result which is a function of more than one parameter has to added as a new parameter.

In this, lesson we will see how to derive this new parameter.

Test	Response	Score
MOBILITY		
SELF-CARE		
USUAL ACTIVITIES		
PAIN / DISCOMFORT		
ANXIETY / DEPRESSION		
Composite Health Index
