

Background

- Let us assume that in a clinical trial, we are interested in the average effect of the drug across all post-treatment values within a subject
- For the dataset to be analysis ready, along with the collected values, we also need the average result stored in the dataset
- We apply rule 3 and create additional rows within the same parameter
 - Rule 3: A function of one or more rows within the same parameter for the purpose of creating an analysis timepoint should be added as a new row for the same parameter.

What is covered in this lesson

- In this lesson, we will see how to create records to store average result of a parameter of all postbaseline records within a subject
