- ECG results are frequently collected in triplicates
- For analysis purposes, let us assume that we need the average of 3 readings collected on a day
- As per ADaM standard, to present the average result within a subject and parameter, we need to add rows within the same parameter

| | | | |
|---|---|---|---|
| QT Interval | Week 1 | Reading 1 | |
| QT Interval | Week 1 | Reading 2 | |
| QT Interval | Week 1 | Reading 3 | |
| QT Interval | Week 1 | | |
| QT Interval | Week 2 | Reading 1 | |
| QT Interval | Week 2 | Reading 2 | |
| QT Interval | Week 2 | Reading 3 | |
| QT Interval | Week 2 | | |

In this lesson,

- We will see how to create the average result of the 3 readings and append the records back to parent data
