Background for visit windowing

- In clinical trials, we collect certain data at planned intervals
- The planned intervals are called 'visits'
- Each planned visit will have a specific target day on which the collection has to be made in an ideal scenario
- This 'planned day' is generally called as 'target day' for that visit
- Sometimes, it is fine to collect the data around the target day by plus or minus a few prespecified number of days
- That is, instead of a target day, the collection can be made in a 'target window'
- Each window will have a target day, beginning timepoint, and an ending timepoint
- Any collection made in the time window for a specific time point (visit) will be analyzed under that visit

Table X: Analysis Visit Windowing Definition

| Analysis Visit (AVISIT) | Analysis Visit Number (AVISITN) | Analysis Window Target (AWTARGET) | Analysis Window Beginning Timepoint (AWLO) | Analysis Window Ending Timepoint (AWHI) |
|-------------------------|---------------------------------|-----------------------------------|--------------------------------------------|-----------------------------------------|
| Week 1                  | 1                               | 7                                 | 2                                          | 11                                      |
| Week 2                  | 2                               | 14                                | 12                                         | 18                                      |
| Week 3                  | 3                               | 21                                | 19                                         | 25                                      |
| Week 4                  | 4                               | 28                                | 26                                         | 32                                      |
| Week 5                  | 5                               | 35                                | 33                                         | 39                                      |

SAP Text Example:

"Analysis visit windowing will be applied to ensure that unscheduled or variable visit dates are correctly assigned to analysis visits. Visits will be assigned to an analysis visit (AVISIT) based on the analysis day (ADY) falling within predefined time windows (AWLO to AWHI). The analysis window target (AWTARGET) represents the planned study day for each visit. Analysis visit numbers (AVISITN) are assigned sequentially from Week 1 onwards."

ADaM implementation

- CDISC ADaM standard allows for visit windowing
- There are standard variables available to use when visit windowing is required
- AWTARGET is used to capture the target day for the visit
- AWLO is used to capture the allowed beginning timepoint for that visit
- AWHI is used to capture the allowed ending timepoint for that visit
- AWU is used to capture the visit window units (days, months, years etc)
