

myCSG © 2026 | Area: ADaM Concept: C1008 : Record level treatment variables | Lesson: ADaM_C1008_L101 : Actual Treatment in Adverse Events dataset in a 3 period crossover study |

Lesson Description

[Site](#)[SAS Video](#)[SAS Program](#)[R Program](#)

- In studies where the same subject takes different treatments over different periods, the treatments taken in each period will be captured in ADSL
- We will have the start and end dates of each period reported in ADSL
- For event start dates or collection dates in other domains, we would be interested in knowing what was the treatment that the subject was on when event started or collection was made
- For this purpose, we have record level treatment variables - TRTP(for planned treatment) and TRTA (for actual treatment)
- We compare the event start/collection date with the period start and end dates and populate the associated treatment based on the period in which the date is falling

Period 1	Period 2	Period 3
Drug A	Drug B	Drug C

Event start/collection	Treatment
In period 1	Drug A
In period 2	Drug B
In period 3	Drug C
After period 3
