

myCSG © 2026 | Area: ADaM Concept: C1009 : ADaM BDS - Analysis Flags | Lesson: ADaM_C1009_L103 : Creation of ANLOFL, multiple record at a timepoint, average result for analysis |

Concept Description	Lesson Description	Site:	SAS Program	R Program
	• In clinical trials, data is expected to be collected at predefined timepoints • Sometimes, there will be multiple collections on a single predefined timepoint • For example, weight collected twice on a single day even when it is supposed to be collected once • In such cases, instead of randomly choosing one of those results for analysis, a predefined algorithm will be provided in statistical analysis plan • One such algorithm is to use the average result at that timepoint for analysis • In this lesson, we will see how we can create average record and flag it for analysis
