

Background
In clinical trials, when taking a drug or investigational product, the trial participant (subject) may experience some untoward medical occurrences along with the intended effect of the drug. These untoward medical occurrences are called 'Adverse events'. An adverse event (AE) is any untoward medical occurrence in a patient or clinical investigation subject administered a pharmaceutical product and which does not necessarily have a causal relationship with this treatment. An adverse event can therefore be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease temporally associated with the use of a medicinal (investigational) product, whether related to the medicinal (investigational) product.
What type of information is typically collected or presented?
• Term described by the subject to explain the adverse event • Start date/time of the event • Status of the event - ongoing or ended? ◦ If ended, end date/time of the event • Severity of the event • Pattern of the event if applicable • Any additional medication given/taken to treat the event • Location and laterality of the event if applicable • Investigator's assessment/action of the event ◦ Relationship/causality to the study drug ◦ Relation to non-study treatment ◦ Is the event serious? ▪ If yes, specific criteria on why the event is considered serious. ▪ Caused cancer ▪ Caused congenital anomaly or birth defect ▪ Caused Persistent or Significant Disability/Incapacity ▪ Resulted in death of the subject ▪ Is the event life threatening ▪ Caused hospitalization or prolonged existing hospitalization ◦ Action taken with the study treatment ◦ Did the event occur with overdose of study medication
