Background
• The immune system protects the body from pathogenic microorganisms and other allergenic toxic substances by producing antibodies. • In some clinical trials, we may have to collect data about immune response of the body. • Some example data points are: ◦ Antidrug antibodies ◦ Hepatitis C Virus Antibody ◦ Antibodies against SARSCOV2 • SDTM standard has a standard domain for capturing these findings - "Immunogenicity Specimen Assessments (IS)" • IS dataset belongs to Findings class and has an expected record structure of 'One record per test per visit per subject'
What type of information is typically collected or presented?
• Date of assessment • Test performed status ◦ Yes ◦ No ▪ Reason not performed • Short name of the test • Name of the test • Result ◦ in original units ◦ in standard units • Normal ranges ◦ lower limit ◦ upper limit • Type of the specimen • Method of assessment • Derived information ◦ Baseline flag - when results of a test are collected over pre and post treatment period
