

Lesson Description

SAS Program

Background
- When creating ADaM datasets, when there is a possibility that more than one record within an analysis visit within a subject and parameter, we create an analysis flag to select the record in by visit analysis tables - When reviewing the datasets of a study, we may want to quickly review the flags across multiple datasets
What is covered in this lesson
In this code, we create a placeholder code which can be quickly modified as per the study requirement and check the flag derivation in the dataset of interest
