

Background
- When reviewing ADSL dataset, we may want to quickly programmatically verify if the population flags are derived correctly - For this, we will need the list of subjects meeting specific criteria from one or more than one dataset for each flag - So, we need to fetch the list of subjects meeting the filter condition and create a separate variable for each dataset/condition - We can then use these variables to verify quickly if the flags are derived correctly
What is covered in this lesson
In this lesson, we will see a framework that can be quickly updated to verify the population flags
