

Background

- SDTM.DM domain is used to capture some important demographics related variables and certain key date variables for the subject
- RFXSTDTC and RFXENDTC are two such date variables
- They are respectively used to capture the 'Date/Time of First Study Treatment' and 'Date/Time of Last Study Treatment' of a subject
- These variables will generally be used in downstream ADaM programming to identify the treatment start and end dates, and to calculate treatment duration
- These variables will be derived using drug administration related raw datasets

What do we learn in this lesson?

- In this lesson, we will see how to derive RFXSTDTC and RFXENDTC
- DEMOG dataset - contains a list of all subjects who participated in the study
- IPADMIN dataset - contains the dosing dates and the box number being used at each visit
