

Background

- SDTM.DM domain is used to capture some important demographics related variables and certain key date variables for the subject
- DTHDTC is one such key date variable.
- This is used to capture the 'Date/Time of Death' of a subject
- Along with DTHDTC, a flag named DTHFL is also created to indicate the death of a subject
- These variables will be derived using the raw dataset corresponding to the end of study case report form

What do we learn in this lesson?

- In this lesson, we will see an approach on how DTHDTC and DTHFL can be derived in SDTM.DM domain
- DEMOG dataset - contains a list of all subjects who participated in the study
- EOS dataset - contains the subject's completion or discontinuation status along with the reason for discontinuation
