

Background

- As part of demographics data, RACE of the participant is always collected and it is an expected variable in SDTM.DM
- Some participants may identify themselves as belonging to more than one race
- So, some clinical trial case report forms are designed to collect all possible races which a subject tries to identify themselves with.
- We will have a separate question for each race value and would typically collect the responses in terms of Yes/No (1/0).

Race (check all that apply)		
American Indian or Alaska Native	RACE, when more than one selected, RACE=MULTIPLE and individual responses areRACE1, RACE2, etc. in SUPPDM	
Asian		
Black or African American		
Native Hawaiian or Other Pacific Islander		
White		
Not Reported		

- If a subject chooses a response of Yes for more than one race, then we need populate it as 'MULTIPLE' in RACE column as per SDTM standard
- The individual race values will be presented in non-standard variables (in supplementary domains - SUPPDM)
