

Background

- Every SDTM dataset that we create will have a set of variables whose values will uniquely identify a record
- This set of variables are called natural key variables
- In addition to the natural keys, we create a derived key variable to uniquely identify a record within a subject
- This derived key is called a surrogate key variable
- The --SEQ variable in the SDTM datasets is an example of a surrogate key
- In most cases, we assign an integer value to the --SEQ variable within a dataset

What will we learn in this lesson?

- In this lesson, we will see how to derive --SEQ variable in an SDTM dataset

USUBJID	VAR1	VAR2	VAR3	SEQ
1001				1
1001				2
1001				3
1002				1
1003				1
1003				2
