

Lesson Description	SAS Program
	• Protocol deviations are typically collected at subject level with start and end dates • There can be instances where some deviations are applicable to all subjects at a site. • Ideally, the same deviation should be entered for all applicable subjects at the site who are actively participating in the study in the time where deviation was in effect/ongoing • There can be cases, where the databases allow them to report deviation at site level - leaving the subject variable null - meaning applicable to all subjects. • In SDTM.DV, we may be asked to populate such deviations for all subjects • Requirement may in short be specified like: "For Site Level Deviations (Missing protdev.subjid) create a record for applicable deviations for each subject at that particular site ."
